

Stakeholder Briefing

The simulation of a cyber attack on our company was conducted to determine our readiness. The target chosen for the simulation included some vulnerability in the system which was discovered quickly using our detection tools. Our Security Operations Center acted swiftly and contained the threat within a few hours.

Performance indicators include threat detection within 2 hours and threat containment within 4 hours. The threat was contained successfully; however, there were certain flaws found that may be exploited during an actual cyber-attack. There were some weaknesses in system and network security which may become a problem during a threat occurrence.

We recommend enhancing our patch management processes, improving the segmentation of our network infrastructure, and investing more into security automation tools which proved successful.

Our security is good but can definitely be improved upon.
